Repeat Signage delivers information to students at Cantraybridge College

Cantraybridge is a small college for adults with learning difficulties who were looking for an electronic noticeboard that could be used in several locations to update staff and students of the coming week's events and if possible to allow the students an input into updating the display.

"Thanks to funding from the Karten Network we were able to purchase two large display screens and Repeat Signage software", revealed Frank Ritchie, IT Enabler, at Cantraybridge in Inverness-Shire.

"One of the things that I particularly like about the software is its compartmentalisation," explained Frank Ritchie. "For instance the office updates an rtf document which updates our weekly events list and it doesn't matter to the overall display if there are mistakes made in this area. Similarly the student association are going to have a news feed hosted on Repeat Signage's RepeatServer which they will be allowed to update and again it is not going to cause any problems to the rest of the display if mistakes are made. The students are already able to update the photo slideshow easily."

"We already have our own news feed on the RepeatServer which the office finds easy to update and we also incorporate the Chief Executive's twitter feed."

"Another feature we have found very useful is that we can have different displays based on the same information. Apart from the two main displays we also have a smaller display running on an old Windows XP machine which only displays the rtf document with the weekly diary and the news feed and this is perfect for where this display is situated."

"Once it is up and running it is so easy to maintain and that makes my life so much easier," says Frank. "At the moment we are only using a small amount of the software's capabilities but already the display is very popular with students and staff as well as being very useful."

You can download the evaluation software without giving your details.
